LIMA HISTORICAL CENTER: INTRODUCING A PEDESTRIAN ZONE

Located at the heart of the city, Lima historical center is a local cultural and economic neighborhood, hosting nearly 20,000 businesses. Lima is working to improve the quality of its streets for residents, work commuters, shoppers and tourists, to conciliate both the cultural legacy, dynamism of the modern city, in a healthy environment. In March 2019, Lima introduced pilot pedestrian streets in a part of the historical center. The pedestrianization program is part of the Lima’s Historic Center Master Plan 2019-2029 with a view to 2035 and approved by Ordinance 2194. This report explores the drivers for action and the potential health benefits promoted by the introduction of the pedestrian streets.

LIMA PEDESTRIAN ZONE

<table>
<thead>
<tr>
<th>60% LESS CAR TRAFFIC</th>
<th>23% MORE PEDESTRIANS</th>
<th>IMPROVED CULTURAL ATTRACTIVENESS</th>
</tr>
</thead>
</table>

DRIVERS FOR ACTION

<table>
<thead>
<tr>
<th>57.5% ADULTS OVERWEIGHT OR OBESE</th>
<th>1,660 PREMATURE DEATHS EACH YEAR DUE TO PM2.5 LEVELS</th>
<th>40% GHG EMISSIONS FROM TRANSPORT</th>
</tr>
</thead>
</table>

Only 15% of adolescents in Peru currently get the recommended amount of weekly physical activity. 57.5% adults are obese or overweight, 5.9% are diabetic, and 13.7% have high blood pressure, a leading indicator of future health issues.1 In Lima, the annual average is 2.8 times higher than the WHO recommended value (10 μg/m3), indicating that people are exposed to harmful levels of air pollution. In Lima, about 1,660 premature deaths every year are attributable to the current PM2.5 levels.2 Lima’s transport sector represents one of the greatest contribution to greenhouse gas (GHG) emissions, accounting for 40% of the total Scope 2.3 Transport also accounts for 58% of PM2.5 concentration in the city, representing the main source of air pollution.

The benefits

C40 has undertaken cutting-edge research, to measure the air quality and health benefits of active mobility and climate action. With support from C40, the city analysed the social impacts of introducing pedestrian streets in the historic center.

The research shows that the benefits would be massive for the commuters and residents’ health. Due to the improved street environment, an increase of 43% pedestrians was noted in the center. Physical activity reduces the risk of mental and physical illnesses and increases life expectancy. Commuters for work, walking twice 20 minutes a day for example, could see their life expectancy increase by a year. The improved air quality, coming from the reduced car traffic, are part of the city’s bigger plan towards a healthier and more liveable environment.

### HEALTH

- **+45,000 PEDESTRIANS**
- **+12 MONTHS IN LIFE EXPECTANCY**
- **90 MINUTES DAILY PHYSICAL ACTIVITY**
- **30% REDUCED RISK OF CARDIO-VASCULAR DISEASES**
- **30% REDUCED RISK OF TYPE 2 DIABETES**
- **30% REDUCED RISK OF BREAST CANCER**
- **30% REDUCED RISK OF COLON CANCER**
- **30% REDUCED RISK OF DEPRESSION**

### SOCIAL

- **IMPROVE WELLBEING & HEALTH**
- **IMPROVE CENTER ATTRACTIVITY & ACCESS TO ACTIVITIES.**
- **DECREASE HEALTHCARE COSTS FROM REDUCED DISEASES.**

### ENVIRONMENT

- **INCREASE SAFETY**
- **IMPROVED AIR QUALITY**
- **REDUCTION IN THE AIR POLLUTION**
- **REDUCED GHG EMISSIONS FROM TRAFFIC**
- **60% LESS ROAD TRAFFIC**
- **23% PM2.5 CONCENTRATION REDUCTION EXPECTED IN THE CENTER**

Change in life expectancy due to increased levels of physical activity. 90 minutes of brisk walking each day can bring massive reductions of diseases.

Reduction in traffic will decrease the concentration in Particulate Matter (PM$_{2.5}$) and Nitrogen Dioxide (NO$_2$). This is part of the city’s bigger plan to reduce air pollution.

See the methodology on active mobility benefits here, and the methodology on air quality impact here. To learn more, see C40 Benefits page.
